Introduction

Mandat Analytic have partnered with Yayasan Dakwah Islam Malaysia (YADIM) in conducting a survey on participants of Konvesyen Madani Rakan Siswa YADIM, which is held on 31st Oct to 2nd Nov 2025.

We recognized that effective youth engagement requires evidence-based understanding, hence this a comprehensive audience profiling analysis is developed and was conducted as part of the program's assessment component

The survey was designed to:

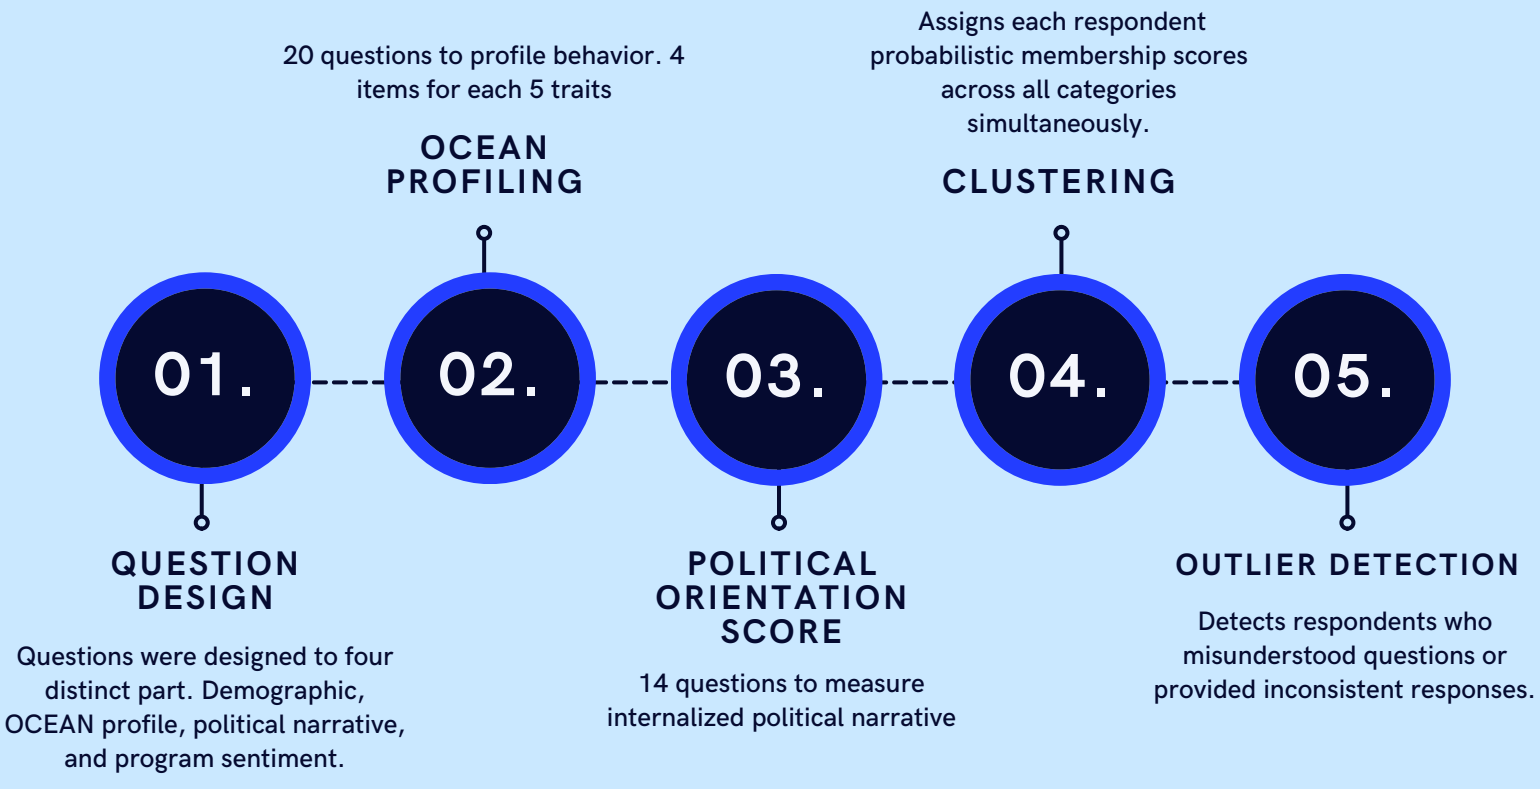
1. Profile the personality composition of the participants;
2. Assess political orientation across respondents and segments them (Pro-Madani, Neutral, Anti-Madani); and
3. Analyze the sentiment of the program to evaluate its effectiveness.

Methodology

The survey consists of four components:

- Demographic questions to establish respondent background;
- A 20-item OCEAN personality module (four items per trait, balanced with reverse-scored items) to capture cognitive style and behavioural predispositions;
- Political narrative internalization section comprising 14 items derived from a prior two-day social media narrative scraping process, where dominant pro-government and opposition narratives were identified, weighted based on virality, emotional intensity, and amplification, and converted into neutral Likert-scale statements;
- Program sentiment section measuring participants' emotional evaluations and perceived value of the event.

OCEAN traits were computed using a validated scoring process with reverse-keyed adjustments, while political orientation was assessed using a narrative-internalization model built from a two-day scraping of Malaysian political discourse across social media platforms. Each narrative was weighted based on virality, emotional intensity, and amplification, and incorporated into a political scoring algorithm further refined through personality-based adjustments. . Respondents were then classified using Fuzzy C-Means clustering, which assigns probabilistic membership to Pro-Madani, Neutral, or Anti-Madani groups, supported by PCA for dimensionality reduction. Local Outlier Factor (LOF) analysis was applied to identify inconsistent or anomalous response patterns, and sentiment data were aggregated to evaluate program effectiveness. This comprehensive methodological approach enables an integrated view of personality structure, narrative absorption, political segmentation, and participant experience.



Building the Political Narrative Question

Systematically mapping the political narrative of Malaysian social media over two days period preceding the survey design. We monitored major platforms including Facebook and Twitter/X, tracking content from both pro-government and opposition sources.

01

SCRAPPING SOCIAL MEDIA

We were not looking for policy positions. We were identifying recurring narrative themes, the stories that kept appearing and being shared from both side.

02

WEIGHTAGE

Each identified narrative was assigned a numerical weight between 0 and 1 based on three quantitative metrics: The virality index, emotional intensity, and amplification.

03

SURVEY QUESTIONS

Once the weighted narratives were identified, we translated each into survey questions that would measure whether respondents had internalized that particular narrative frame.

Example Questions

OCEAN QUESTIONS

Saya lebih selesa mengikut pendekatan yang telah terbukti berkesan berbanding mencuba kaedah baharu yang belum teruji *

Saya lebih suka bekerja mengikut garis panduan yang jelas, berbanding diberikan kebebasan untuk menguji idea baru

- Sangat Tidak Setuju
- Tidak Setuju
- Neutral
- Setuju
- Sangat Setuju

POLITICAL NARRATIVE

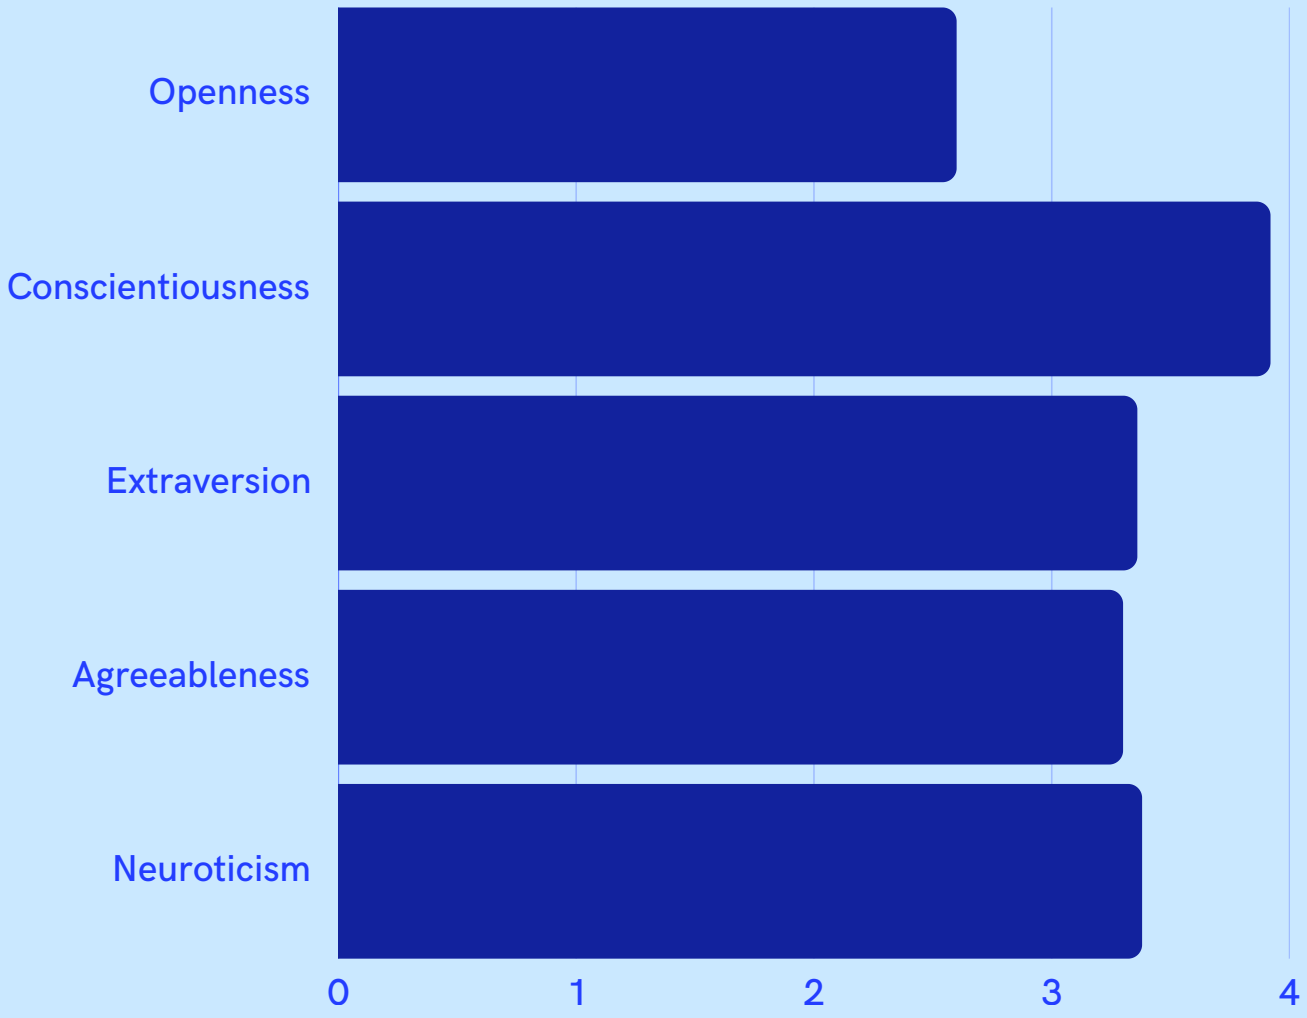
Saya berpandapat rundingan perdagangan dengan negara kuasa besar seperti Amerika Syarikat lebih tinggi risiko keatas kedaulatan negara berbanding, manfaat untuk peluang ekonomi

Pengurangan subsidi untuk golongan berpendapatan tinggi ialah langkah yang adil berbanding mengekalkan subsidi menyeluruh untuk semua.

- Sangat Tidak Setuju
- Tidak Setuju
- Neutral
- Setuju
- Sangat Setuju

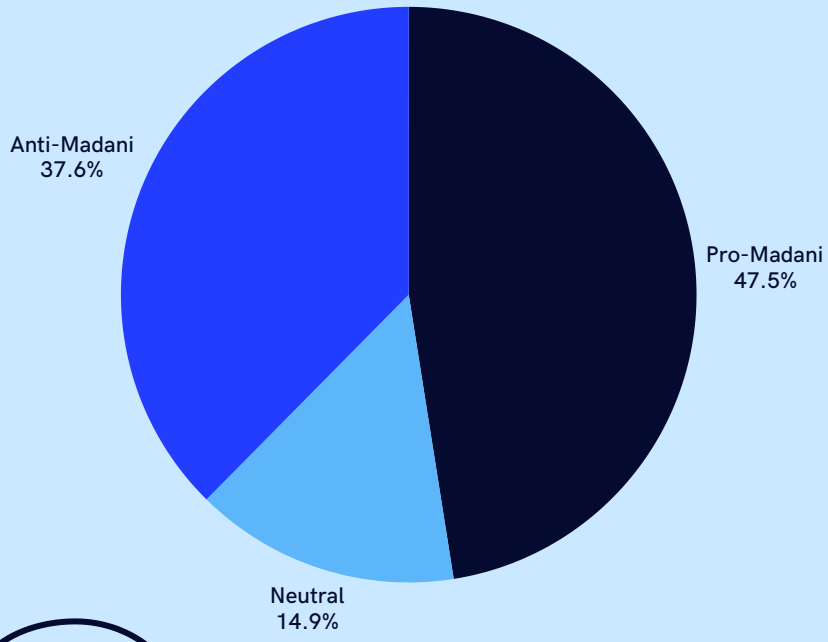
OCEAN Result

This personality configuration reveals several important characteristics of this program psychographic. Low Openness (2.6) is the most striking finding. This sample shows significantly below-average openness, which signaled preference for familiar ideas over novel concepts, lower receptivity to progressive or reformist messaging, and conservative cognitive style favoring tradition.

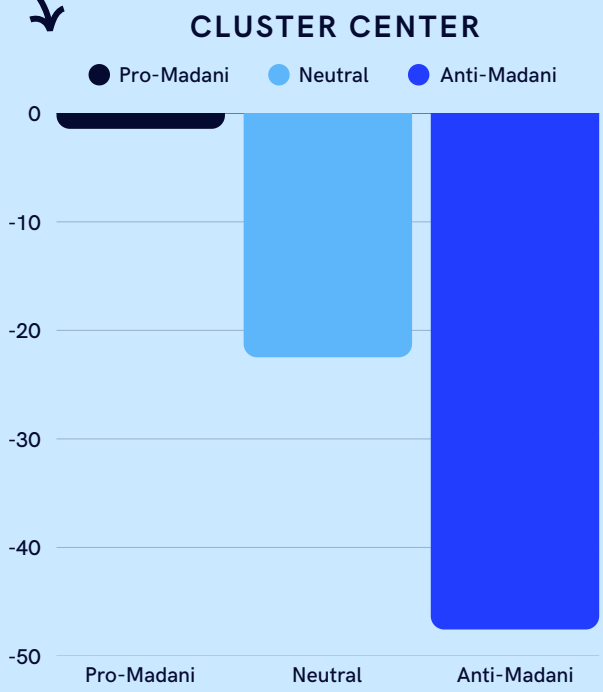


Political Orientation Result

The most significant methodological contribution of this study is reframing political orientation assessment from "who the participants support?" to "which narratives have the participants internalized?" This is a fundamentally different and arguably more accurate way to understand political positioning in the digital age.



Near-zero score suggests they haven't deeply internalized government messaging
"Support" means "slightly less oppositional" rather than genuine alignment



Political Orientation Result

The political orientation analysis does not measure simple political preference or party loyalty; instead, it evaluates how strongly each respondent has *absorbed, repeated, or aligned with dominant digital political narratives* circulating in Malaysia. The classification into Pro-Madani, Neutral, and Anti-Madani emerges from a combination of weighted narrative responses, personality-adjusted scoring, and probabilistic clustering. The results reveal a structurally imbalanced narrative in which Anti-Madani narratives are more deeply internalized than Pro-Madani ones.

WHAT THESE RESULTS INDICATE?

The analysis shows that Pro-Madani scores are relatively shallow and sit close to the neutral threshold, meaning that "support" in this context reflects limited exposure rather than strong conviction. In contrast, Anti-Madani alignment appears more consolidated, suggesting participants are exposed to opposition narratives that are more dominant, emotionally charged, and consistently reinforced across their media ecosystem. The cluster centers further confirm this structural imbalance: the Anti-Madani center is distinctly formed while the Pro-Madani center lacks depth, indicating that government messaging has weaker penetration among the cohort. Combined with the group's personality profile, particularly low Openness and higher Conscientiousness - these conditions create a narrative lock-in effect where youths tend to stick with the first narrative they encounter, making subsequent counter-messaging less effective. As a result, the findings reveal a psychologically and structurally challenging environment for government-aligned narratives to gain traction.

Political Orientation Result

Top 10 Pro Madani Respondent

Phone number	Gender	Age	Pro-Madani Probability
013-7243721	Perempuan	21	83.332
012-4839145	Perempuan	19	83.33
017-9649851	Perempuan	22	83.329
019-9060233	Perempuan	21	83.328
017-9017108	Lelaki	19	83.328
011-70145514	Lelaki	24	83.328
019-7611370	Perempuan	20	83.326
011-39190496	Lelaki	21	83.322
011-51154927	Perempuan	21	83.322
011-40474993	Perempuan	20	83.315

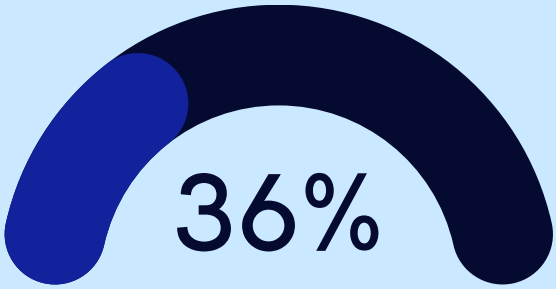
Political Orientation Result

Top 10 Anti Madani Respondent

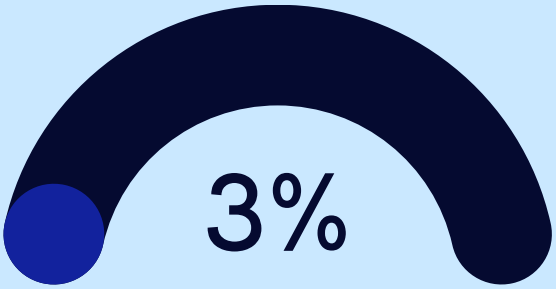
Phone number	Gender	Age	Anti-Madani Probability
011-29371125	Perempuan	18	83.179
011-25614275	Perempuan	18	83.179
019-4439897	Lelaki	20	83.165
011-11124868	Lelaki	20	83.096
014-6767889	Perempuan	20	83.063
014-7753248	Lelaki	22	83.059
011-33699174	Lelaki	19	83.039
011-10997734	Perempuan	19	83.009
010-9624866	Lelaki	20	82.948
017-5516248	Lelaki	22	82.939

Sentiment Result

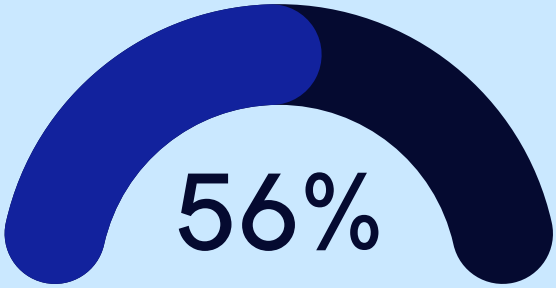
92% of participants had a positive or neutral experience with the program. Only 3% expressed negative sentiment, indicating the program was well-received and professionally executed. The 56% neutral response suggests the program met expectations without exceeding them or transformative.



POSITIVE



NEGATIVE



NEUTRAL

Conclusion

NARRATIVE ENVIRONMENT IMBALANCE

The findings indicate that YADIM is operating within a digital environment where government-aligned narratives have limited penetration, while opposition-leaning messages dominate the information environment of youth. Rather than interpreting this as a structural disadvantage, this imbalance highlights a clear opportunity for YADIM to play a more proactive and strategic role in shaping healthier, more balanced narrative ecosystems. The weak internalization of pro-government narratives among "Pro-Madani" respondents suggests that **current messaging needs to be fine tuned** to better cater these new waves of youth. This presents YADIM with the chance to position itself as a trusted messenger capable of filling the current narrative gap, with **targeted messaging and recruitment strategy**.

LOCK-IN EFFECT

When this narrative imbalance is viewed alongside the cohort's personality profile, marked by lower Openness and higher Conscientiousness - a clear **lock-in effect** emerges. These traits are associated with preference for familiarity, stability, and early-formed impressions. Anti-Madani narratives, having reached them first and more consistently, become the "default frame" through which many participants interpret political content. This creates a structural challenge. The data suggests that once youths internalize a message early, it becomes their default lens; therefore, investing in **continuous engagement, campus presence, and narrative-based youth programs** can secure long-term attitudinal alignment. Rather than being a barrier, the lock-in effect highlights the importance of sustained early influence, offering YADIM a pathway to cultivate resilient, values-driven youth advocates who carry these perspectives into their social circles and digital spaces.

Recommendations

The current RSY cohort has a personality profile misaligned with typical government messaging. Two major recommendations suggested:

1 REDESIGN MESSAGING

Redesign communications with themes like restoration, order, responsibility, proven approaches. This improves conversion rates for existing participants. Reframe program messages from "Change" to "Restoration". This approach will ensure that participants internalize key narratives in a way that resonates with their psychological makeup, gradually filling the current gap in the youth information environment.

2 PERSONALITY-BASED RECRUITMENT

Design the next recruitment to deliberately oversample high-Openness individuals. High-Openness youth tend to be intellectually influential in their networks. These individuals are naturally curious, open to new ideas, and tend to be intellectually influential within their social and digital networks. Engaging high-Openness participants early ensures that program content spreads organically through peer influence, amplifying the reach and impact of the messaging.
